Notifications

- Posts notifications from within your script
- Notification alerts (non-blocking under Mac OS 9)
- Custom sound notifications
- Blinking icon in the applications or Apple menu
- Black diamond in the applications menu

24U Appearance OSAX gives you the features you always missed when wanted your scripts to communicate with user.

The five features available in the version 1.2 let you pop-up alerts, display dialogs, open floating text message windows, show progress indicators, and post all kinds of notifications.

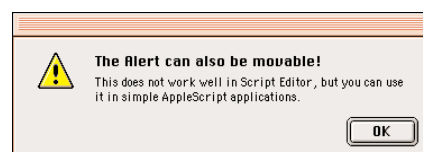

For all that the new commands are so easy to use that you will only rarely make mistakes when writing your scripts.

With the new command “display better dialog” you can display much better and much more complex dialogs than with the “display dialog” command.

The “display alert” command allows you to display standard Appearance alert you know from Mac OS 8 or newer.

The alert can also be movable, so you can switch to another application and back before dismissing it.

You can also use a detailed explanation in your alerts. This gives you a chance to explain user the indicated problem in further de-

tail while leaving the error message enough visible and strong.

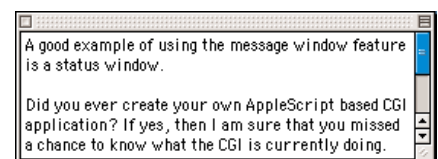

For indicating work progress, 24U Appearance OSAX offers very easy to use floating progress indicators.

With a simple command, you create a new progress indicator, which you can then update as your work continues.

Also that simple are floating text messages. You can open as many floating windows as you want, and you can display any text in them.

If you make any floating window resizable, it will include a vertical scroll bar so that user can read the whole text even if it does not fit in the window.

24U Appearance OSAX can be used under any Mac OS system with Appearance installed. However, the floating message windows and progress indicators require at least Mac OS 8.6.
