- Does not require you to install the Developer Tools package
- No need to learn/understand anything else but AppleScript
- Freeware bundling for free

24U Appearance OSAX 2.0 gives your Mac OS X the features you always missed when wanted your scripts to communicate with user.

The five features available in this version let you pop-up alerts, display dialogs, open floating text message windows, show progress indicators, and post notifications.

For all that the new commands are so easy to use that you will only rarely make mistakes when writing your scripts.

With the new command “display better dialog” you can display much better and much more complex dialogs than with the “display dialog” command.

The “display alert” command allows you to display standard alerts you know from other applications.

Alerts are movable and non-blocking, so you can switch to another application and back before dismissing them.

You can also use a detailed explanation in your alerts. This gives you a chance to explain user the indicated problem in further detail while leaving the error mes-

sage enough visible and strong.

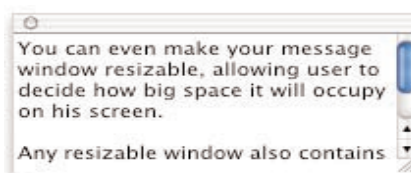

For indicating work progress, 24U Appearance OSAX offers very easy to use floating progress indicators.

With a simple command, you create a new progress indicator, which you can then update as your work continues.

Also that simple are floating text messages. You can open as many floating windows as you want, and you can display any text in them.

If you make any floating window resizable, it will include a vertical scroll bar so that user can read the whole text even if it does not fit in the window.

24U Appearance OSAX 2.0 works natively on Mac OS X and is 100% compatible with your scripts compiled for the previous Mac OS 9 version. However, it also utilizes better user interface of Mac OS X, for example including non-blocking movable dialog boxes.
